Version	Date	Comment	Author
Initial	2015	Standard	D Mulsant
V2	October 2016	Include –B versions of Cradle and CCB, and Trafico	D Mulsant
V3	Nov. 2016	Include code with no audio	D Mulsant
Final	January 2017		D Mulsant

1. Aim of the document

This document presents the various configurations of TPH900 used in cars.

After providing a general overview, the second chapter describes the features and characteristics of the main components. Last chapter introduces the references codes of the solution for ordering. It includes the upgrade between P2G or TPH700 to TPH900 car configurations.

This document is a product description.

It is not an installation guide.

2. General overview

The schematic bellow presents the two TPH900 car configurations. Some elements are optional items, or may be ordered separately, please check Ordering Options chapter.

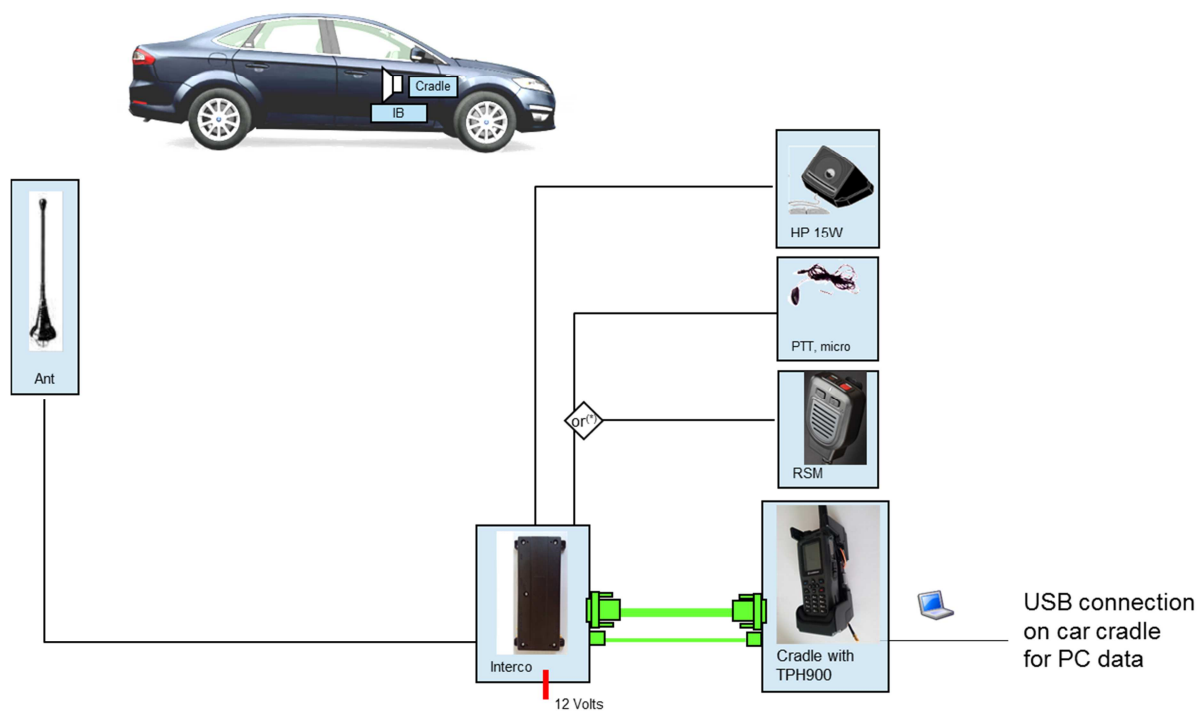

Figure 1: TPH900 car configuration 2 Watts

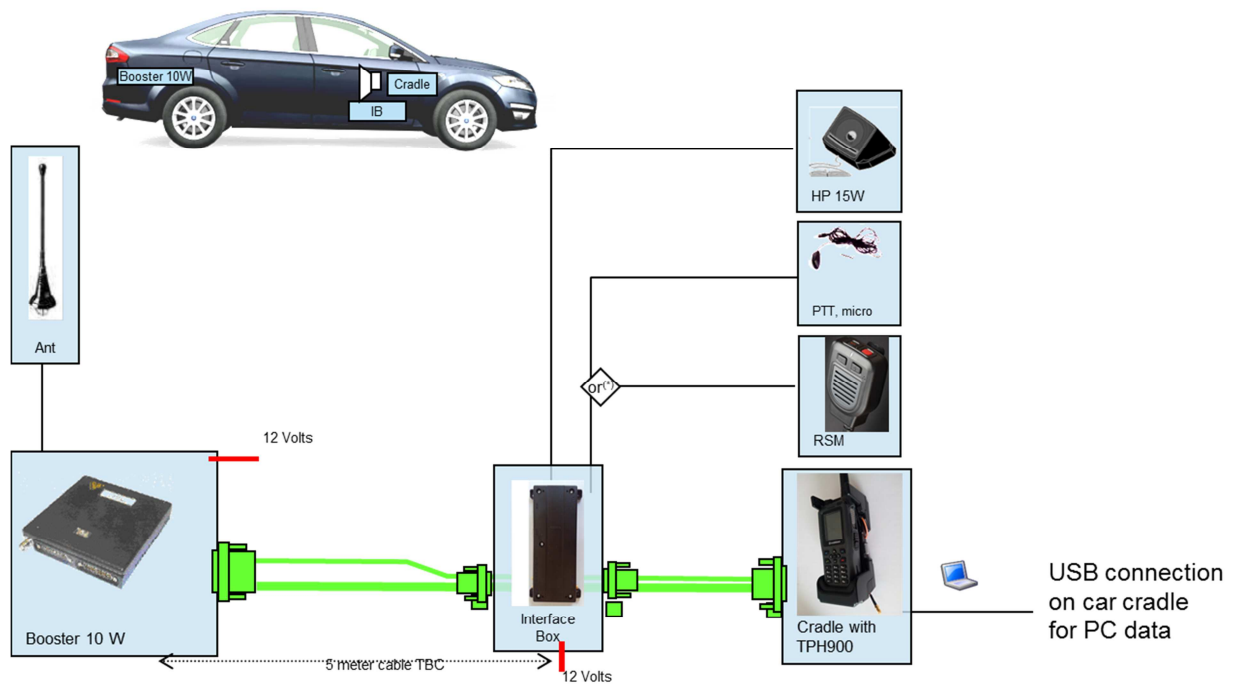

Figure 2: TPH900 car configuration with Booster (10 Watts)

Note that Booster 10W in the back is indicative.

3. Basics on use cases

Standard features

Car configurations are installed in car and trucks. Choice is made between standard (2W) and with booster (10W) configurations, depending on the need of enhanced Radio Frequency coverage or not. User benefits from following functions.

- TPH900 is securely positioned of the in the car, with a specifically designed cradle. This cradle will ensure firm and robust attachment of the TPH900 in the car, also complying with standard EU regulations for inside vehicle equipment.
- Access to TPH900 features can be achieved handsfree, with external PTT key or Speaker Microphone, and loudspeaker.

Discreet installations are also possible, connecting wired PTT, microphone and earphones to the CCB900 instead of the RSM.

When TPH900 is in cradle:

Remote Speaker Microphone can be used. Only one communication can thus be handled at the same time.

For discreet configuration, press on the wired PTT, allows the driver to initiate call without using PTT on the TPH900. The speech goes through the wired microphone. The received audio goes through the external loudspeaker 40hms (option) or the binaural earpiece. Radiated signal will be sent by the car antenna and not the TPH900, thus giving more coverage. 10W booster enhances also the emission, when installed in the car.

Location - Identification

TPH900 can receive GPS location signal. When used in a car configuration, car cradle shall then be connected to external antenna either GPS or dual PMR/GPS.

For configurations using AVL server from AIRBUS SLC, an "IDENT" identification option exists.

TPH900 is then able to transmit the IDENT via DTAP.

Figure 3 Location and Identification management

With HR9623BAA01, TPH900 is able to transmit an IDENT coming from external equipment and sent via DTAP protocol or via HR9623. The IDENT value can be stored in the CCB900 so that external equipment is no longer needed.

TPH900 allows user to configure IDENT with a specific user interface in maintenance mode. With this UI, a maximum 15 numerical characters string can be define for the IDENT.

As for today, AIRBUS AVL server offers access either to IDENT information or to RFSI information (attached to Terminal) provided by network.

4. Component descriptions

Car cradle TPH900 – HR9080

TPH900 car cradle is specific to TPH900, as any cradle is to one radio.

The product offers the following features:

- Connection of power supply to the terminal
- Connection to external antenna with one antenna cable dual band (Tetrapol and GPS)
- Connection to external device through μ USB port. Connection to data with μ USB/USB and μ USB/RS232.

The product is IP40.

Cradle can be attached thanks to swivel solution (optional).

Figure 4 TPH900 Car cradle picture

Note that audio accessories, when plugged on the TPH900 side interface, may not be usable when radio is inserted in the cradle. This priority management will depend upon items connected to the CCB.

TPH900 cradle allows the user to insert the radio with one hand. Removing the radio is also done with one hand only.

Note that it is mandatory to press the side buttons to allow easy extraction.

Note that RF antenna cable is now colored in black.

Reference codes

HR9080AA	Car cradle V1	Includes mounting swivel
HR9080CA	Car cradle V2 (2017)	Antenna cable black, Includes mounting swivel
HR9080DA	Car cradle V2 (2017)	Antenna cable black, No swivel included

CCB_900 – HR9623

Car Configuration Box (CCB) is a new element in car kits configuration, compared to P2G/TPH700 solutions.

Figure 5 HR9623 - CCB_900

With 2016 version, CCB900 can now be installed up to 2m from cradle, with different cable variants.

CCB_900 main features are:

- Interface between the cradle, the BIV Smart;
- Interface to external antenna, PMR antenna, or dual band PMR/GPS antenna,
- Management of audio links: to/from Remote Speaker Microphone, loudspeaker, ...
- Power supply management for TPH900 5V - 4A (vs 6.5V for P2G)
- Provide identification of the vehicle it is installed in. Therefore, a menu is available in the TPH900 to set up this identification.

BIV Smart - HR6723

Existing BIV Smart can be used with the retrofit kit. Software must be at least 010202.

AIRBUS will provide two possible configurations:

- Retrofit kit, to upgrade existing P2G or TPH700 configurations to TPH900
- Complete kit, to be installed in a new vehicle.

Nevertheless, the BIV smart box is connected to CCB900.

Installation kit is HT7528.

Remote Speaker Microphone – HR9035

Remote speaker microphone is the connected on CCB900.

Installation is done thanks to pivot located on back of RSM.

When user is pressing volume +/-, it interacts directly with TPH900 audio volume.

Figure 6 : HR9035 - TPH900 RSM for car kit

An extension cable exists to install RSM up to 2 meter from CCB900.
Connectivity is SUBD15 high density.

Loudspeaker – HC1194

Power : 20W

Impedance : 8 ohms

Dimensions: 176x186x80mm

Cable length 2,000m with MOLEX plug to connect to CCB.

Figure 7 : HC1194 - Loudspeaker

Mounting includes a Molex connector for installation in car kits.

Discreet configuration – HT11004

Discreet installation consists in plugging wired audio and PTT on the CCB900 on the plug dedicated to RSM.

It shall be highlighted that both car cradle and CCB900 have to be installed.

Discreet kit will include one cable (HG5445AA) to which three accessories are attached:

- Microphone,
- Binaural earpiece,
- PTT key.

This configuration is to be ordered separately.

Figure 8 : Discreet audio/PTT accessories for TPH900 car kit

Description	Qty	reference

5. Car configurations

2015 car configuration concept would see cradle and CCB900 positioned within 2 meters.
 With 2016 configuration, distance between cradle and CCB900 can be extended up to 6 meters.
 The two following schematics provide general understanding of the car kit concepts.

TPH900 2W configuration

Figure 18 Car configuration 2W - components

6. Ordering

Antennas are ordered separately.

Note that the B version of cradle/CCB includes 2017 features (§3).

An CCB900-B will work only with a cradle-B.

Configurations with 2W capacity

TPH900 2W initial configuration

This configuration will be phased out in 2017.

7. Installations options

Options for Cradle

Car cradle HR9080 can be alternatively attached with swivel or with a metal plate. This kit is sometimes used for installation in gloves compartment. Please note that gloves compartments are now quite smaller that they were in the 90'.

HT6159 kit has been developed for P2G installations in gloves compartment. It includes:

- a metal plate (see figure below).
- A fixing plate PA5329A
- Screws etc.

Figure 21 Option with Metal plate holder kit

Reference: HT6159

Re-use of Pioneer loudspeaker

In case integrator would like to re-use the old Pioneer loudspeaker, recommendation is to purchase Molex connectors with wiring as in bellow scheme.

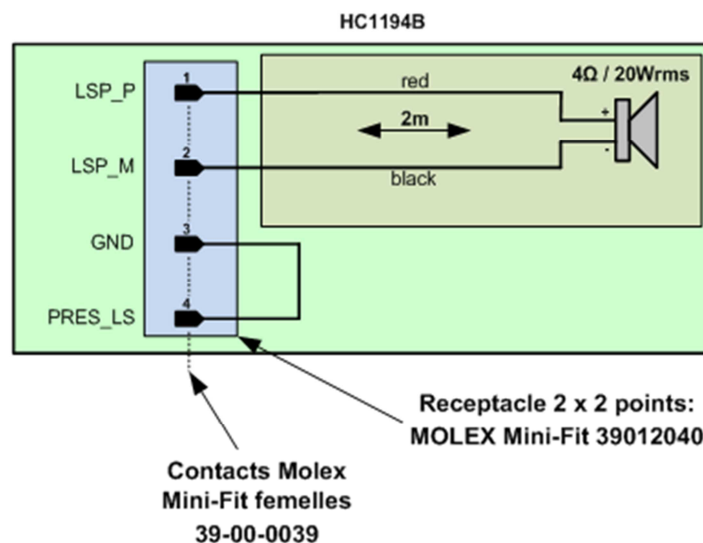

Figure 22 : Molex wiring

Kit Molex HT11248 is available in HR9704CA & HR9715BA.
